Application

Many information structures of computer science are based on trees.

(日)

In an undirected tree, a leaf is a vertex of degree 1.

Definition

An acyclic graph is called a forest.

Example:

Proposition

A forest G on n vertices has n - c(G) edges, where c(G) is the number of components of G.(True for any graph)

Dr. G.H.J. Lanel (USJP)

Graph Theory and Its Applications

In an undirected tree, a leaf is a vertex of degree 1.

Definition

An acyclic graph is called a forest.

Example:

Proposition

A forest G on n vertices has n - c(G) edges, where c(G) is the number of components of G.(True for any graph)

For a graph G = (V, E) of order n = |V|, the following are equivalent

- G is acyclic and has n 1 edges.
- G is connected and has n 1 edges.
- G is connected and acyclic.
- $\bigcirc \forall u, v \in V$ there is one and only one path from u to v.
- G is acyclic and adding an edge creates one and only one cycle.
- G is connected and removing an arbitrary edge disconnects it.

For a graph G = (V, E) of order n = |V|, the following are equivalent

- G is acyclic and has n 1 edges.
- G is connected and has n 1 edges.
- G is connected and acyclic.
- \bigcirc $\forall u, v \in V$ there is one and only one path from u to v.
- G is acyclic and adding an edge creates one and only one cycle.
- G is connected and removing an arbitrary edge disconnects it.

For a graph G = (V, E) of order n = |V|, the following are equivalent

- G is acyclic and has n 1 edges.
- G is connected and has n 1 edges.
- G is connected and acyclic.
- \bigcirc $\forall u, v \in V$ there is one and only one path from u to v.
- G is acyclic and adding an edge creates one and only one cycle.
- G is connected and removing an arbitrary edge disconnects it.

For a graph G = (V, E) of order n = |V|, the following are equivalent

- G is acyclic and has n 1 edges.
- **2** G is connected and has n 1 edges.
- G is connected and acyclic.
- $\textcircled{0} \ orall u, v \in V$ there is one and only one path from u to v.
- G is acyclic and adding an edge creates one and only one cycle.
- G is connected and removing an arbitrary edge disconnects it.

For a graph G = (V, E) of order n = |V|, the following are equivalent

- G is acyclic and has n 1 edges.
- G is connected and has n 1 edges.
- G is connected and acyclic.
- $\forall u, v \in V$ there is one and only one path from u to v.
- G is acyclic and adding an edge creates one and only one cycle.
- G is connected and removing an arbitrary edge disconnects it.

For a graph G = (V, E) of order n = |V|, the following are equivalent

- G is acyclic and has n 1 edges.
- G is connected and has n 1 edges.
- G is connected and acyclic.
- $\forall u, v \in V$ there is one and only one path from u to v.
- **6** *G* is acyclic and adding an edge creates one and only one cycle.
- G is connected and removing an arbitrary edge disconnects it.

For a graph G = (V, E) of order n = |V|, the following are equivalent

- G is acyclic and has n 1 edges.
- G is connected and has n 1 edges.
- G is connected and acyclic.
- $\forall u, v \in V$ there is one and only one path from u to v.
- 6 G is acyclic and adding an edge creates one and only one cycle.
- G is connected and removing an arbitrary edge disconnects it.

A tree is called a rooted tree if one vertex has been designated the root, in which case the edges have a natural orientation, towards or away from the root.

Example:

A tree is called a rooted tree if one vertex has been designated the root, in which case the edges have a natural orientation, towards or away from the root.

Example:

An application

A rooted trees can be used to phrase sentences.

An application

A rooted trees can be used to phrase sentences.

Dr. G.H.J. Lanel (USJP)

Lecture 5 9 / 15

- In a rooted tree, the depth or level of a vertex v is its distance from the root.
- The height of a rooted tree is the length of a longest path from the root.
- If vertex v immediately precedes vertex w on the path from the root to w, then v is parent of w and w is child of v.
- Vertices having the same parent are called siblings.
- A leaf in a rooted tree is any vertex having no children.

- In a rooted tree, the depth or level of a vertex v is its distance from the root.

An ordered tree is a rooted tree in which the children of each vertex are assigned a fixed ordering.

Definition

An *m*-ary tree $(m \ge 2)$ is a rooted tree in which every vertex has *m* or fewer children

Definition

A complete *m*-ary tree is an *m*-ary tree in which every internal vertex has exactly *m* children and all leaves have the same depth.

An ordered tree is a rooted tree in which the children of each vertex are assigned a fixed ordering.

The eccentricity $\varepsilon(u) = \max_{v \in V} d(u, v)$ of a node is the maximum distance to any node $v \in V$.

Proposition

Let T be a tree and let T' be the tree obtained by removing all its leafs, then $\varepsilon(T') = \varepsilon(T) - 1$ for all nodes of T'.

Proposition

The center of a tree is a single node or a pair of adjacent nodes.

Proof

By induction and using the previous proposition. Show that the center does not change.
