#### Definition

Let *f* be a continuous function defined on  $a \le x \le b$  and let  $a = x_0 < x_1 < x_2 < ... < x_{n-1} < x_n = b$  be endpoints of *n* sub-intervals of interval [a, b]. Let  $\Delta x = \frac{b-a}{n}$  and  $x_i^* \in [x_{i-1}, i]$  (i = 1, 2, ..., n)

Then, the definite integral of f from a to b is

$$\int_{a}^{b} f(x) dx = \lim_{n \to \infty} \sum_{i=1}^{n} f(x_{i}^{*}) \Delta x$$

provided that this limit exists. It gives the same value for all possible choices of sample points  $x_i^*$ . If it does exist, we say that *f* is integrable on [*a*, *b*].

#### Note 01: The quantity

$$\sum_{i=1}^n f(x_i^*) \Delta x$$

#### is known as Riemann sum.

Note 02: The definite integral

$$\int_{a}^{b} f(x) dx$$

is a number and it does not depend on x.

#### Note 01: The quantity

$$\sum_{i=1}^n f(x_i^*) \Delta x$$

is known as **Riemann sum**.

Note 02: The definite integral

$$\int_{a}^{b} f(x) dx$$

is a number and it does not depend on x.

#### Theorem

If f is continuous on [a, b], or if f has only a finite number of jump discontinuities, then f is integrable on [a, b]; that is, the definite integral

 $\int_a^b f(x) dx$ 

exists.

Suppose that we divide the interval [*a*, *b*] into *n* sub-intervals of equal length  $\Delta x = \frac{b-a}{n}$ , and  $x_i^*$  is any point in the *i*th sub-interval  $[x_{i-1}, x_i]$ . Then we have

$$\int_{a}^{b} f(x) dx \approx \sum_{i=1}^{n} f(x_{i}^{*}) \Delta x$$

Suppose that we divide the interval [*a*, *b*] into *n* sub-intervals of equal length  $\Delta x = \frac{b-a}{n}$ , and  $x_i^*$  is any point in the *i*th sub-interval  $[x_{i-1}, x_i]$ . Then we have

$$\int_{a}^{b} f(x) dx \approx \sum_{i=1}^{n} f(x_{i}^{*}) \Delta x$$

### 1. Left endpoint approximating:

The point  $x_i^*$  is chosen to be the left endpoint of the interval. Then,

$$\int_{a}^{b} f(x) dx \approx L_{n} = \sum_{i=1}^{n} f(x_{i-1}) \Delta x$$

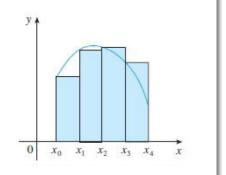

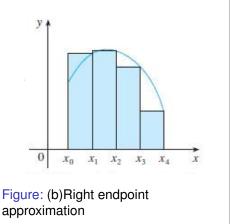

Figure: (a)Left endpoint approximation

#### 2. Right endpoint approximating:

The point  $x_i^*$  is chosen to be the right endpoint of the interval. Then,

$$\int_{a}^{b} f(x) dx \approx R_{n} = \sum_{i=1}^{n} f(x_{i}) \Delta x$$

• • • • • • • • • • • • •

#### 3. Midpoint rule:

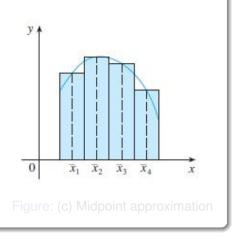

The point  $x_i^*$  is chosen to be the mid point  $\bar{x}_i$  of the interval. Then,

$$\int_{a}^{b} f(x) dx \approx M_n = \sum_{i=1}^{n} f(\bar{x}_i) \Delta x$$

**Error bound:** Error  $E_M$  of mid point rule is bounded by

$$|E_M| \leq \frac{K(b-a)^3}{24n^2}$$

where  $|f''(x)| \leq K$  for  $a \leq x \leq b$ .

### 3. Midpoint rule:

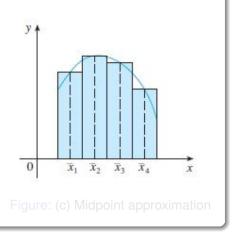

The point  $x_i^*$  is chosen to be the mid point  $\bar{x}_i$  of the interval. Then,

$$\int_{a}^{b} f(x) dx \approx M_n = \sum_{i=1}^{n} f(\bar{x}_i) \Delta x$$

**Error bound:** Error  $E_M$  of mid point rule is bounded by

$$|E_M| \leq \frac{K(b-a)^3}{24n^2}$$

where  $|f''(x)| \leq K$  for  $a \leq x \leq b$ .

### 3. Midpoint rule:

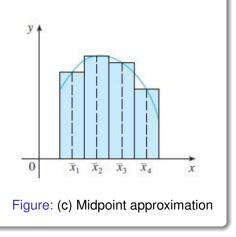

The point  $x_i^*$  is chosen to be the mid point  $\bar{x}_i$  of the interval. Then,

$$\int_{a}^{b} f(x) dx \approx M_{n} = \sum_{i=1}^{n} f(\bar{x}_{i}) \Delta x$$

**Error bound:** Error  $E_M$  of mid point rule is bounded by

$$|E_M| \leq \frac{K(b-a)^3}{24n^2}$$

where  $|f''(x)| \le K$  for  $a \le x \le b$ .

#### 4. Trapezoidal rule:

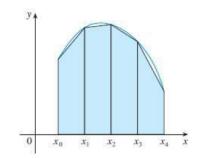

Averaging left and right end approximations,

$$\int_{a}^{b} f(x) dx \approx T_{n} = \frac{\Delta x}{2} [f(x_{0}) + 2f(x_{1}) + \dots + 2f(x_{n-1}) + f(x_{n})]$$

**Error bound:** Error  $E_T$  of trapezoidal rule is bounded by

$$|E_T| \leq \frac{K(b-a)^3}{12n^2}$$

where  $|f''(x)| \leq K$  for  $a \leq x \leq b$ .

#### Figure: (d) Trapezoidal Approximation

#### 4. Trapezoidal rule:

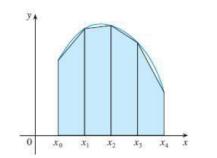

Averaging left and right end approximations,

$$\int_{a}^{b} f(x) dx \approx T_{n} = \frac{\Delta x}{2} [f(x_{0}) + 2f(x_{1}) + \dots + 2f(x_{n-1}) + f(x_{n})]$$

**Error bound:** Error  $E_T$  of trapezoidal rule is bounded by

 $|E_T| \leq \frac{K(b-a)^3}{12n^2}$ 

where  $|f''(x)| \le K$  for  $a \le x \le b$ .

#### Figure: (d) Trapezoidal Approximation

#### 4. Trapezoidal rule:

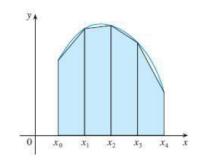

Averaging left and right end approximations,

$$\int_{a}^{b} f(x) dx \approx T_{n} = \frac{\Delta x}{2} [f(x_{0}) + 2f(x_{1}) + \dots + 2f(x_{n-1}) + f(x_{n})]$$

**Error bound:** Error  $E_T$  of trapezoidal rule is bounded by

$$|E_T| \leq \frac{K(b-a)^3}{12n^2}$$

where  $|f''(x)| \le K$  for  $a \le x \le b$ .

#### Figure: (d) Trapezoidal Approximation

#### 5. Simpson's rule:

Let n be even. Using parabolas to approximate the curve (instead of lines),

$$\int_{a}^{b} f(x)dx \approx S_{n} =$$

$$\frac{\Delta x}{3}[f(x_{0}) + 4f(x_{1}) + 2f(x_{2}) + 4f(x_{3}) + \dots + 2f(x_{n-2}) + 4f(x_{n-1}) + f(x_{n})]$$
Error bound: Error  $E_{S}$  of Simpson's rule is bounded by
$$|E_{S}| \leq \frac{K(b-a)^{5}}{180n^{4}}$$
where  $|f^{(4)}(x)| \leq K$  for  $a \leq x \leq b$ .

### 5. Simpson's rule:

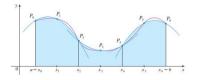

Let n be even. Using parabolas to approximate the curve (instead of lines),

$$\int_a^b f(x)dx \approx S_n = \frac{\Delta x}{3} [f(x_0) + 4f(x_1) + 2f(x_2) + 4f(x_3) + \dots + 2f(x_{n-2}) + 4f(x_{n-1}) + f(x_n)]$$

**Error bound:** Error  $E_S$  of Simpson's rule is bounded by

$$|E_{\mathcal{S}}| \leq \frac{K(b-a)^5}{180n^4}$$

where 
$$|f^{(4)}(x)| \leq K$$
 for  $a \leq x \leq b$ .

- Find the exact value of the definite integral  $\int_{1}^{2} \frac{1}{x} dx$ . (Give your answer to 6 decimal places.)
- Prind the approximated value of the definite integral  $\int_{1}^{2} \frac{1}{x} dx$  using each method given above. (Give your answer to 6 decimal places.)
  - Use left end approximation with n = 5,10 and 20.
  - **O** Use right end approximation with n = 5,10 and 20.
  - **()** Use mid point approximation with n = 5,10 and 20.
  - Use trapezoidal rule with n = 5,10 and 20.
  - **I** Use Simpson's rule with n = 5,10 and 20.

#### Area function

Let  $g(x) = \int_a^x f(t)dt$  where *f* is continuous and  $a \le x \le b$ . The function *g* is known as the area function; area under the graph of *f* from a to *x*, where *x* can vary from *a* to *b*.

If *f* is the function whose graph is shown and  $g(x) = \int_0^x f(t)dt$  find g(0), g(1), g(2), g(3), g(4), g(5) and sketch a rough graph of *g*.

True or false?

$$\int_{-1}^{3} \frac{1}{x^2} = -\frac{4}{3}$$

Justify your answer.

イロト イヨト イヨト イヨト

# Exercise 16 (Use any computational software.)

The sine integral function is defined as

$$Si(x) = \int_0^x \frac{\sin(t)}{t} dt$$

[The integrand  $f(t) = \sin t/t$  is not defined when t = 0, but we know that it's limit is 1 when  $t \rightarrow 0$ . So we define f(0) = 1 and this makes f a continuous function everywhere.]

- Oraw the graph of Si
- At what values does this function have local maximum values?
- Find the coordinates of the first inflection point to the right of the origin.
- Oces this function have horizontal asymptotes?

Solve the following equation correct to one decimal place:  $\int_0^x \frac{\sin(t)}{t} dt = 1$
